ProbSevere products

- **ProbSevere v2**
 - Operational
 - Source: NCEP
- **ProbSevere v3**
 - Experimental
 - Source: UW-CIMSS
- **ProbSevere LightningCast**
 - Experimental
 - Source: UW-CIMSS
 - T20 beginning soon
 - expected completion: Dec 2024

ProbSevere v3

Probabilistic next-hour severe weather models

- **Data sources**

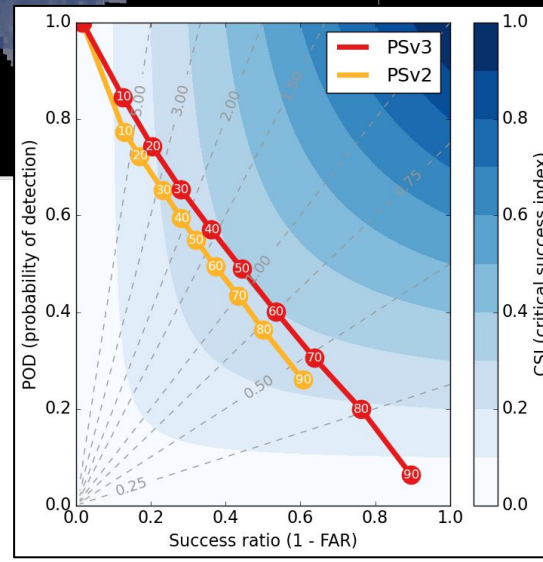

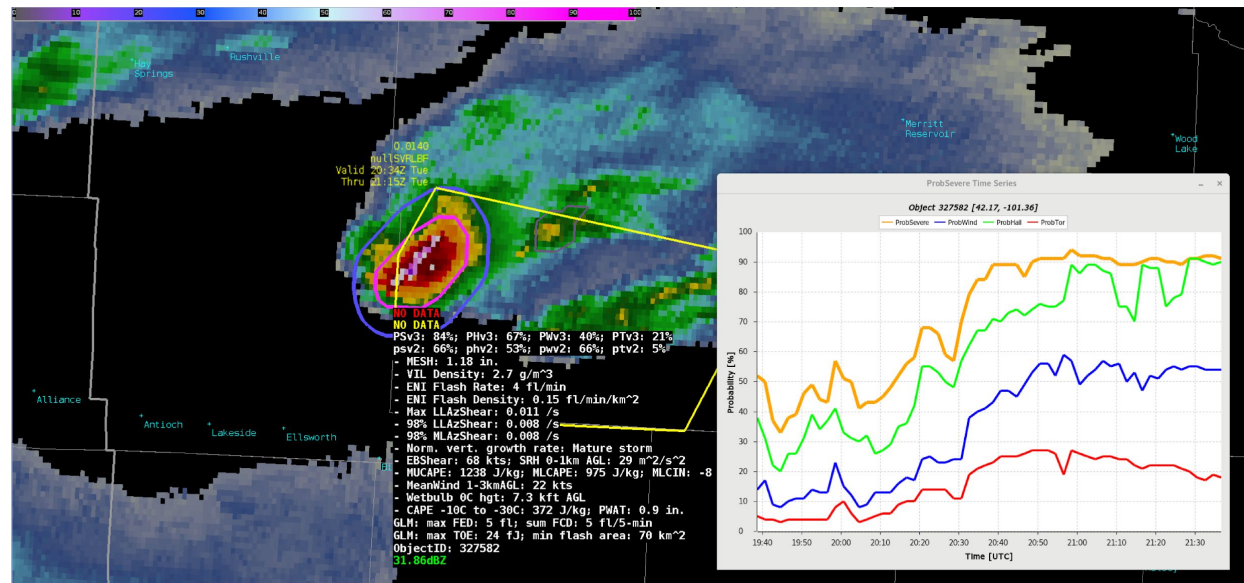

- MRMS
- ENI Lightning
- GOES-East (ABI and GLM)
- HRRR

- **Improvements**

- Improved overall calibration
- Better in so-so environments
- Better discernment among hazard types

- **Weaknesses**

- Very weak-shear regimes
- Dry microbursts
- Weak tornadoes

Akron, OH – 26 May 2021

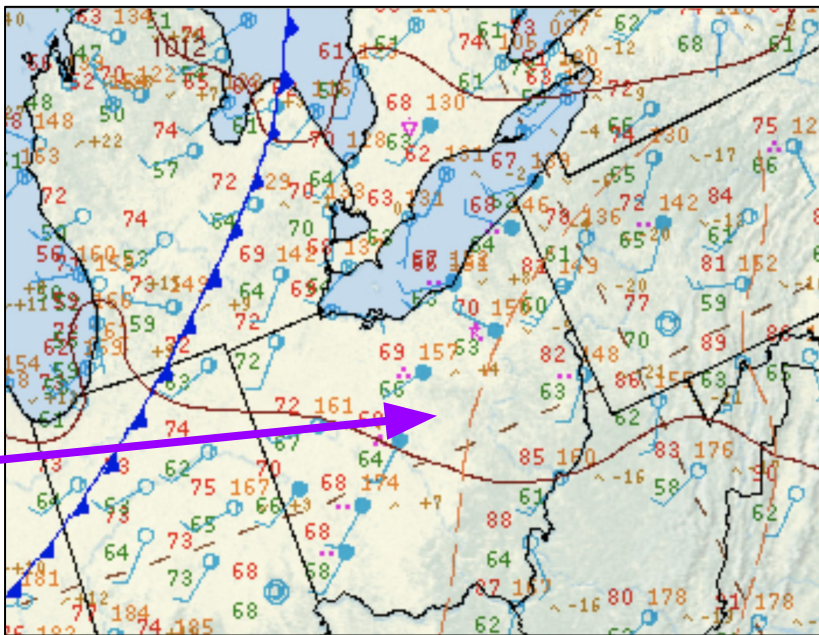

700 mb mesoanalysis (18Z)

subtle shortwave

Strengthening lapse rate 0-3 km

18Z surface analysis

surface trough

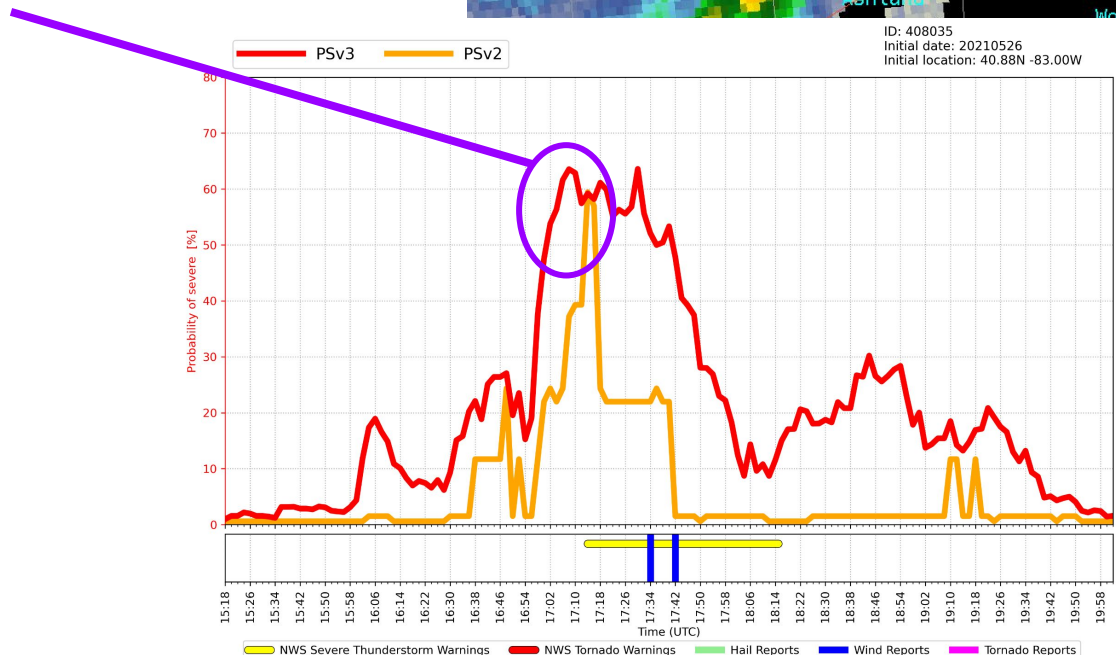

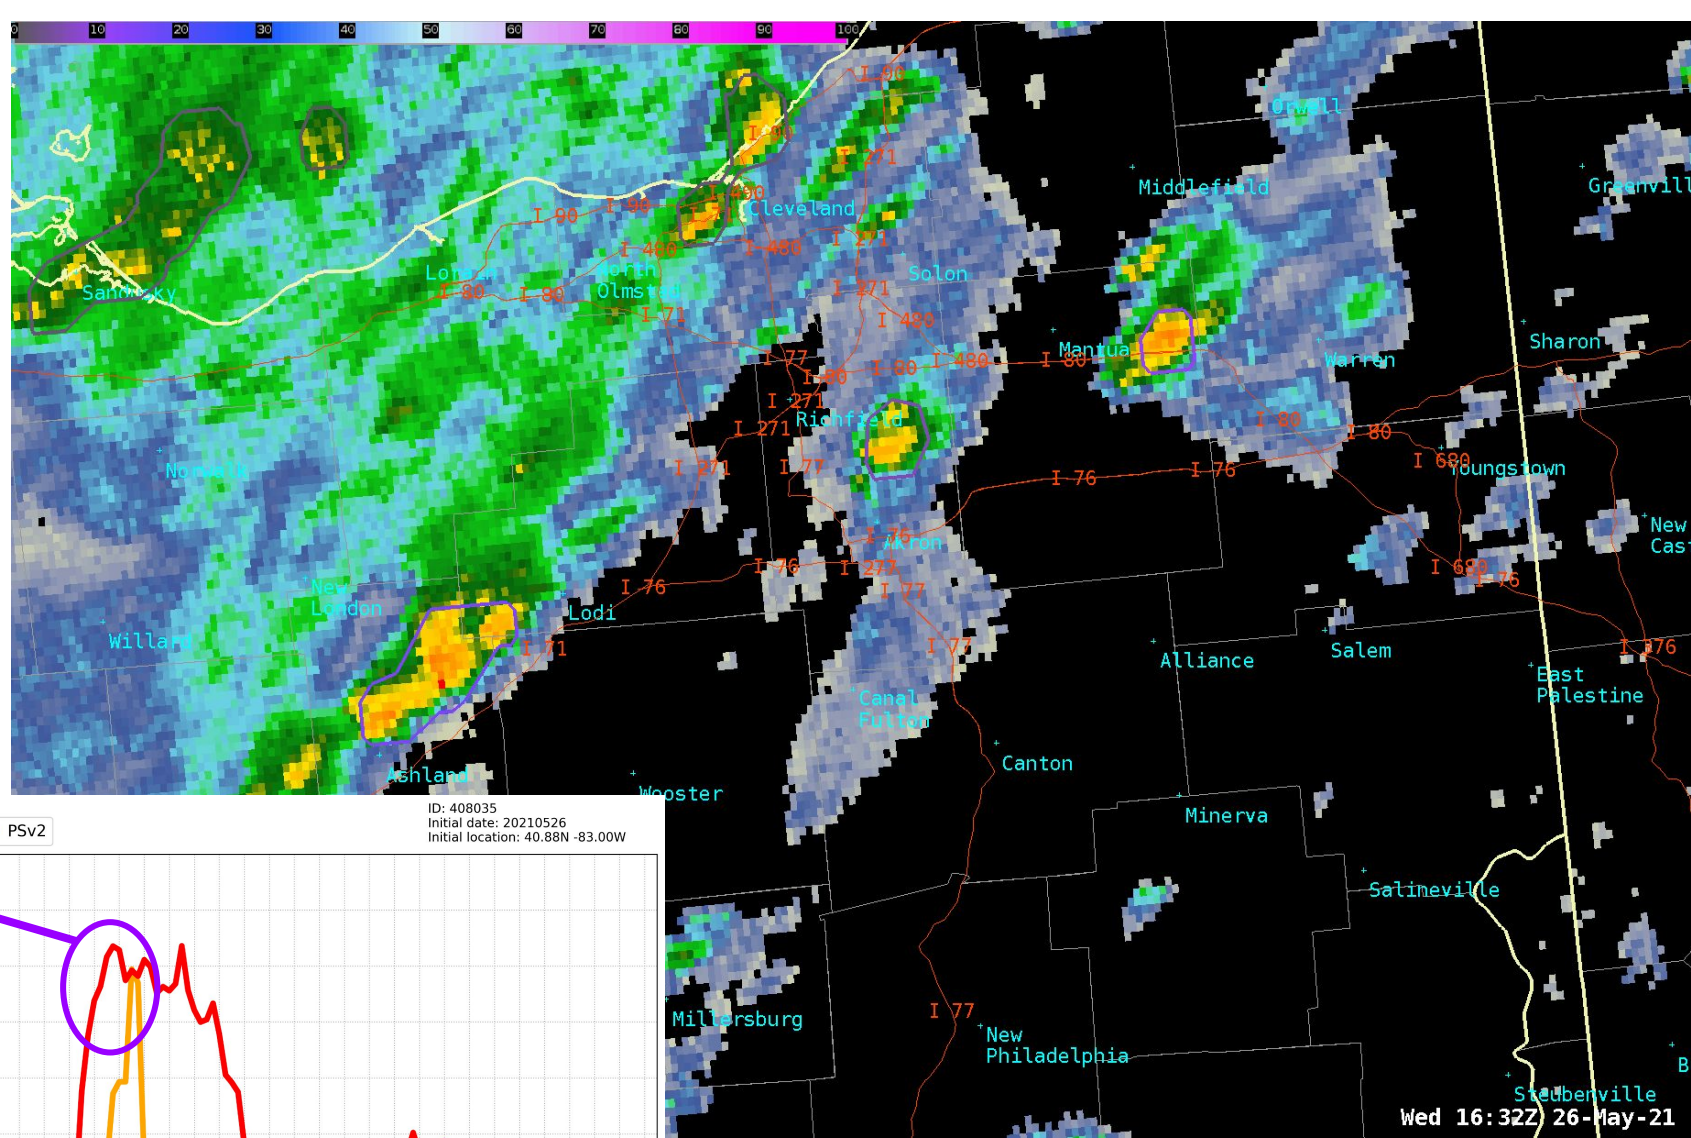

SPC's 13Z outlook

Main threat is wind

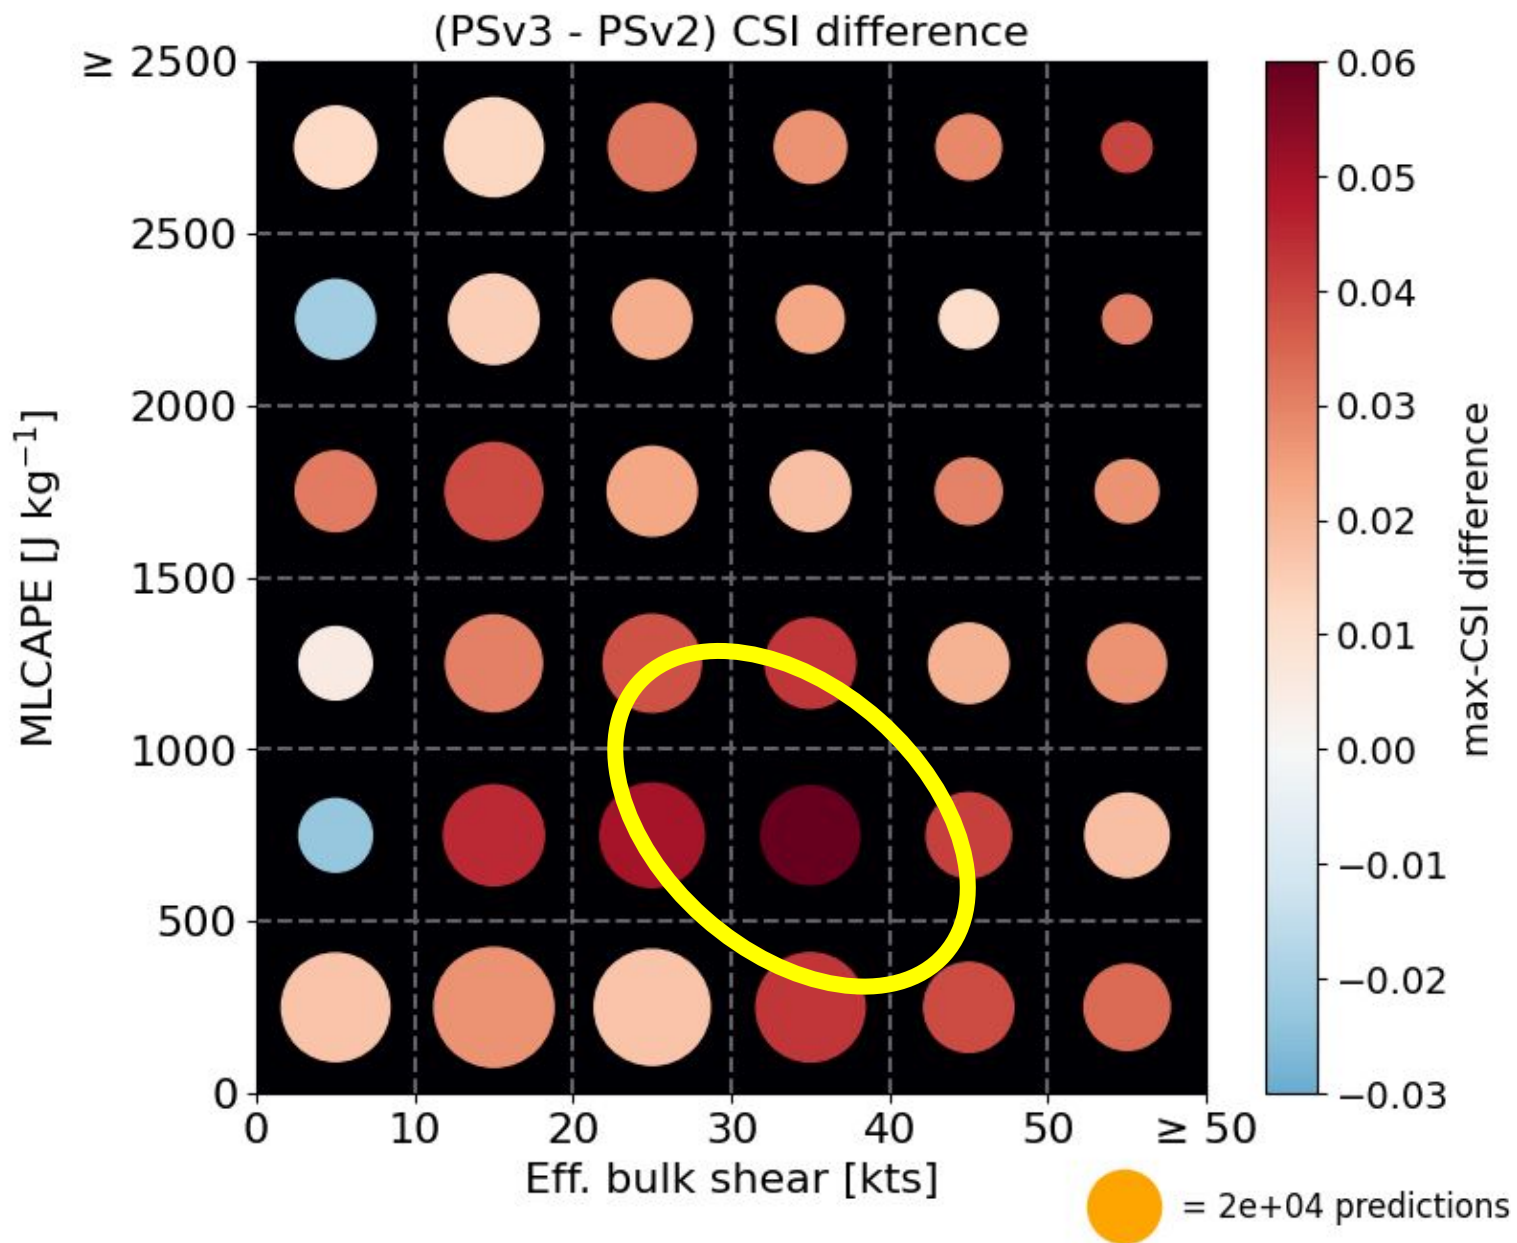

- PSv3 quickly ramped up to 60%
 - Mean wind 1-3 km : 33 kt
 - LLLR: 8.2 C/km
 - strong MRMS azshears
- Multiple wind reports in Akron
- PSv3 trends often *smoother* and *earlier ramp up* than PSv2
- PSv2 “caught up” 10 min later

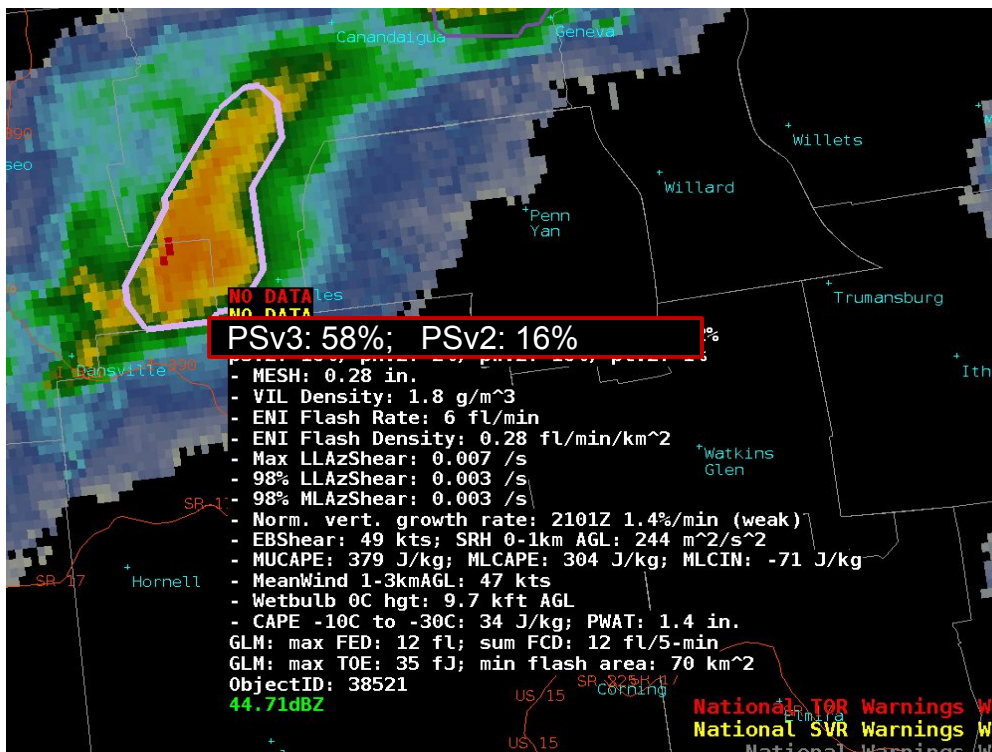

- MUCAPE of 700 J/kg and effective bulk shear of 30 kt
 - Zone of strongest improvement

Western New York – 05 April 2023

- HSLC; low lightning flash rate
PSv3 = 58% (PSv2 = 16%) 15 min prior to warning; 22 min prior to first report
- 75-85 mph microbursts—destroying barn, power poles, and trees

Top predictors:

- Mean wind 1-3 km (47 kt)
- Eff. bulk shear (50 kt)
- ENI flash rate (6 fl/min)
- 0-3 km lapse rate (7.2 °C/km)

Gaylord, MI tornado 20 May 2022

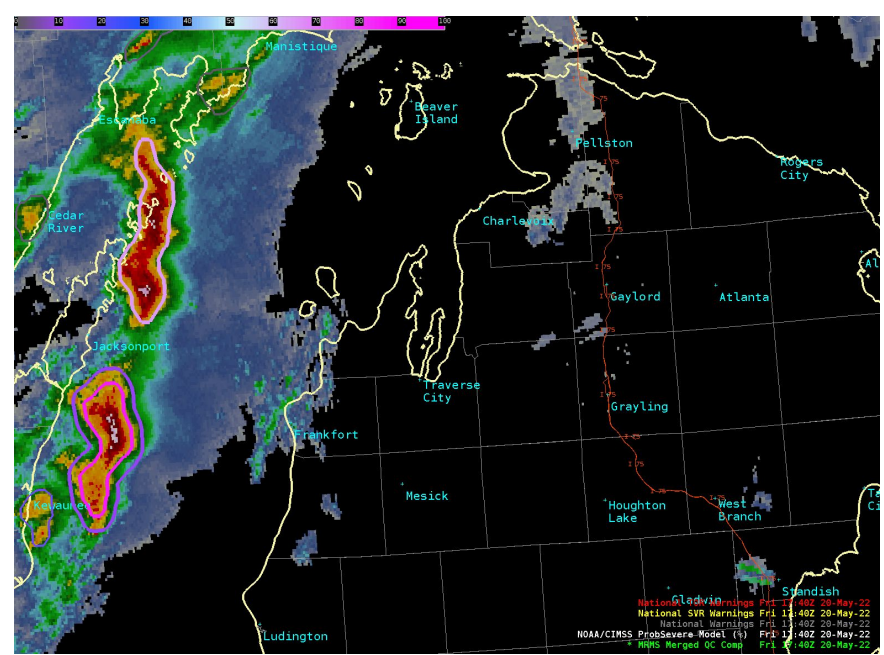

Strong cold front

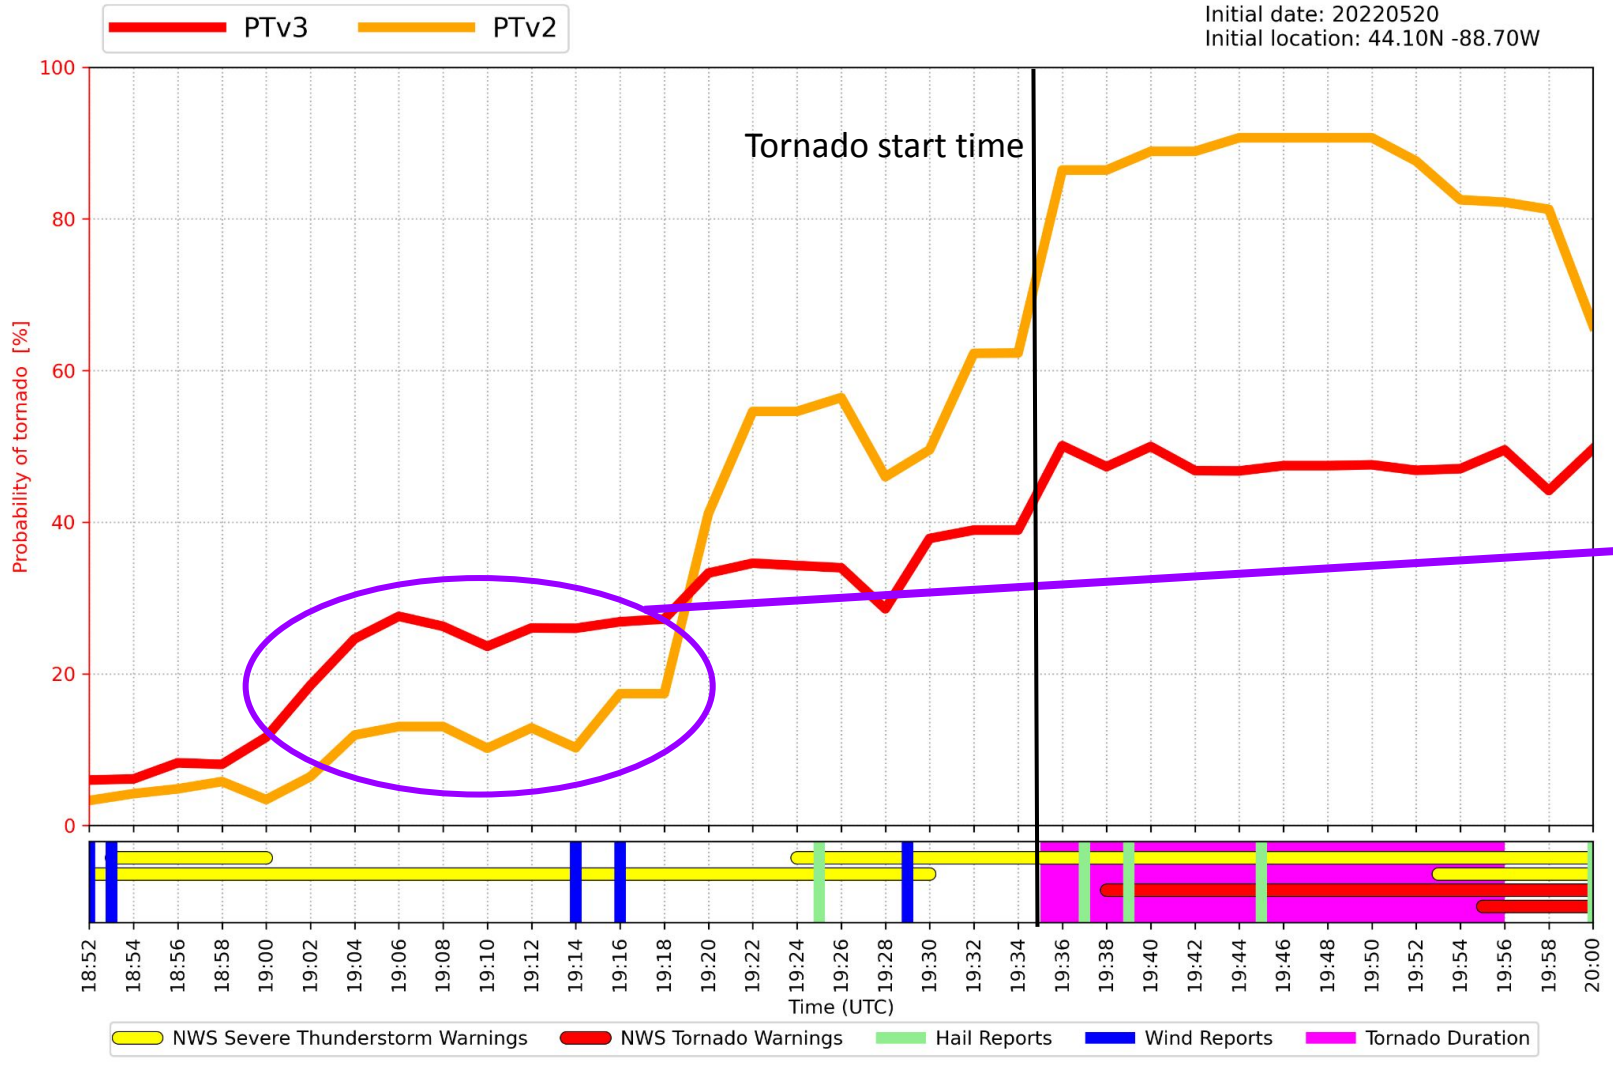

$STP_{eff} > 2$ (20Z mesoanalysis)

SPC tornado outlook (1630Z)

ID: 170381
 Initial date: 20220520
 Initial location: 44.10N -88.70W

- PTV3 increases before PTV2
- PTV3 10-15% higher than PTV2
 - Have seen as much as 30% higher in other tornadic storms
- PTV3 generally maxes out at ~60% as opposed to PTV2 (~90%).
 - PTV3 captures the noise/uncertainty inherent in MRMS AzShear data

Critical Success Index (CSI) at probability $\geq 50\%$

CSI difference (PSv3-PSv2 @ best-CSI prob. thresh.)

LightningCast

Probabilistic next-hour lightning nowcast model

- **Data sources**

- GOES-16 or GOES-18 ABI
- 0.64 μm , 1.6 μm , 10.3 μm , 12.3 μm

- **Products**

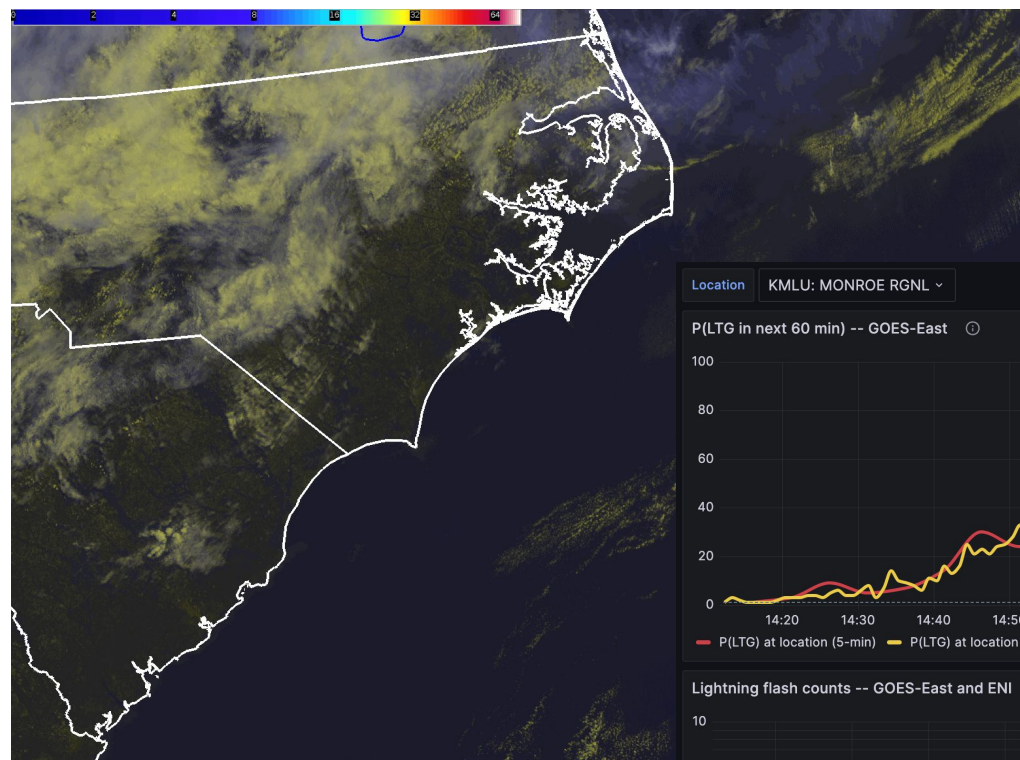

- GOES-16 or -18 CONUS, mesos
- Parallax-corrected or uncorrected

- **Strengths**

- Very good at lightning initiation (LI)

- **Weaknesses**

- Developing convection under thick ice
- Lower lead time in explosive CI
- Less skill in cool season

Summary

- **ProbSevere v3**
 - Better probability calibration
 - Improvement in moderate-CAPE moderate-shear environments
 - Improvement in high-shear low-CAPE environments
 - PTV3 earlier ramp up than PTV2 in tornadic storms
- **LightningCast**
 - Skillful at lightning initiation nowcasts
 - Time series capability at TAF airports
 - Working to improve cool season performance
 - T2O (NESDIS) starting soon, expected completion Dec 2024
- GRLevel placefiles available for PSv3 and LightningCast (CONUS and MESOs)
